

Insulation monitoring relays CM-IWN.4/5/6

For unearthed AC, DC and mixed AC/DC systems up to $U_n = 400 \text{ V AC}$ and 600 V DC

The CM-IWN serves to monitor insulation resistance in accordance with IEC 61557-8 in unearthed IT AC systems, IT AC systems with galvanically connected DC circuits, or unearthed IT DC systems with a voltage up to 400 V AC and 600 V DC. The measuring range can be extended up to 690 V AC and 1000 V DC by using the coupling unit CM-IVN. It can be configured to the requirements of the applications and therefore used multi-functional.

All devices are available with two different terminal versions. You can choose between the proven screw connection technology (double-chamber cage connection terminals) and the completely tool-free Easy Connect Technology (push-in terminals).

Characteristics

- For monitoring the insulation resistance of unearthed IT systems up to $U_n = 400 \text{ V AC}$ and 600 V DC
- According to IEC/EN 61557-8 “Electrical safety in low voltage distribution systems up to 1000 V a.c. and 1500 V d.c. – Equipment for testing, measuring or monitoring of protective measures – Part 8: Insulation monitoring devices for IT systems”¹⁾
- Specifically for applications with high system leakage capacitances, for example in photovoltaic environments
- Rated control supply voltage 24-240 V AC/DC
- Prognostic measuring principle with superimposed square wave signal
- Two measuring ranges 1-100 k Ω and 2-200 k Ω
- One (1 x 2 c/o) or two (2 x 1 c/o) threshold values $R_{an1}/R1$ ¹⁾ (warning) and $R_{an2}/R2$ ²⁾ (prewarning) configurable³⁾
- Precise adjustment of the threshold values in 1 k Ω steps (R1) and 2 k Ω steps (R2)
- Interrupted wire detection configurable
- Non-volatile fault storage configurable
- Open- or closed-circuit principle configurable
- Precise adjustment by front-face operating controls
- Screw connection technology or Easy Connect Technology available

- Housing material for highest fire protection classification UL 94 V-0
- Tool-free mounting on DIN rail as well as demounting
- 45 mm (1,77 in) width
- 3 LEDs for the indication of operational states

¹⁾ CM-IWN.6 does not meet the requirements of IEC/EN 61557-8 regarding the response time t_{an} .

²⁾ term acc. to IEC/EN 61557-8

³⁾ R2 only active with 2 x 1 c/o configuration

Approvals

- UL 508, CAN/CSA C22.2 No.14
- IEC/EN 60947-5-1, CB scheme
- GB14048.5 - 2001, CCC
- EAC
- RMRS

Marks

- CE
- RCM

Connection technology

Maintenance free Easy Connect Technology with push-in terminals

Type designation CM-xxN.yyP

Push-in terminals

- Tool-free connection of rigid and flexible wires with wire end ferrule according to DIN 46228-1-A, DIN 46228-4-E
Wire size: 2 x 0.5-1.5 mm², (2 x 20 - 16 AWG)
- Easy connection of flexible wires without wire end ferrule by opening the terminals
- No retightening necessary
- One operation lever for opening both connection terminals
- For triggering the lever and disconnecting of wires you can use the same tool (Screwdriver according to DIN ISO 2380-1 Form A 0.8 x 4 mm (0.0315 x 0.157 in), DIN ISO 8764-1 PZ1 ø 4.5 mm (0.177 in))
- Constant spring force on terminal point independent of the applied wire type, wire size or ambient conditions (e. g. vibrations or temperature changes)
- Opening for testing the electrical contacting
- Gas-tight

Approved screw connection technology with double-chamber cage connection terminals

Type designation CM-xxN.yyS

Double-chamber cage connection terminals

- Terminal spaces for different wire sizes:
fine-strand with/without wire end ferrule:
1 x 0.5-2.5 mm² (2 x 20 - 14 AWG),
2 x 0.5-1.5 mm² (2 x 20 - 16 AWG)
rigid:
1 x 0.5-4 mm² (1 x 20 - 12 AWG),
2 x 0.5-2.5 mm² (2 x 20 - 14 AWG)
- One screw for opening and closing of both cages
- Pozidrive screws for pan- or crosshead screwdrivers according to DIN ISO 2380-1 Form A 0.8 x 4 mm (0.0315 x 0.157 in), DIN ISO 8764-1 PZ1 ø 4.5 mm (0.177 in)

Both the Easy Connect Technology with push-in terminals and screw connection technology with double-chamber cage connection terminals have the same connection geometry as well as terminal position.

Application / monitoring function

The CM-IWN serves to monitor insulation resistance in accordance with IEC 61557-8 in unearthed IT AC systems, IT AC systems with galvanically connected DC circuits, or unearthed IT DC systems.

The insulation resistance between system lines and system earth is measured. If this falls below the adjustable threshold values, the output relays switch into the fault state.

The device can monitor control circuits (single-phase) and main circuits (3-phase).

Supply systems with voltages $U_n = 0-400$ V AC (15-400 Hz) or 0-600 V DC can be directly connected to the measuring inputs and their insulation resistance being monitored. For systems with voltages above 400 V AC and 600 V DC the coupling unit CM-IVN can be used for the expansion of the CM-IWN voltage range.

Measuring principle

A pulsating measuring signal is fed into the system to be monitored and the insulation resistance calculated.

This pulsating measuring signal alters its form depending on the insulation resistance and system leakage capacitance. From this altered form the change in the insulation resistance is forecast.

When the forecast insulation resistance corresponds to the insulation resistance calculated in the next measurement cycle and is smaller than the set threshold value, the output relays are activated or deactivated, depending on the device configuration. This measuring principle is also suitable for the detection of symmetrical insulation faults.

Additional monitoring functions

When interrupted wire detection  is activated, the CM-IWN automatically controls the system/measuring circuit connections L+ and L- when the system starts up. This can be repeated at any time by activating the test function. The CM-IWN cyclically monitors the measuring circuit connections \perp and KE for wire interruption. In case of a wire interruption in one of the connections, the output relays switch to the fault state.

In addition, the unearthed AC-, DC- or AC/DC system is monitored for inadmissible system leakage capacitance. If the system leakage capacitance is too high, the output relays switch to the fault state.

Also incorrect settings that could cause a faulty function of the device are monitored. When the device detects such an incorrect setting, the output relays switch to the fault state.

Operating mode

The system to be monitored is connected to terminals L+ and L-. The earth potential is connected to terminals \perp and KE. Depending on the setting, the device operates according to the open-circuit principle  (fault state: relay energized) or closed-circuit principle  (fault state: relay de-energized).

Once the control supply voltage has been applied the insulation monitoring relay runs through a system test routine. The system is diagnosed and the settings are tested. If no internal or external faults are found after this test routine is completed, the output relays switch into the operational state.

All operating states are signalled by the front-face LEDs. See table "LEDs, status information and fault messages" on page 10.

Configuration 1 x 2 c/o contacts (warning)

With this configuration the settings for the threshold value for prewarning (R2) have no influence on the operating function. If the measured value drops below the set threshold value, the output relays switch into the fault state. If the measured value exceeds the threshold value plus hysteresis, the output relays switch back into their original state.

Configuration 2 x 1 c/o contact (prewarning and warning)

If the measured value drops below the set threshold value for prewarning the second output relay 21-22/24 switches. If the measured value drops below the threshold value for warning, the first output relay 11-12/14 switches.

If the measured value exceeds the threshold value for warning plus hysteresis, the first output relay 11-12/14 switches back into its original state. If the measured value exceeds the threshold value for prewarning plus hysteresis, also the second output relay 21-22/24 switches back to its original state.

Test function

The test function is only possible when there is no fault.

By pressing the front-face combined test/reset button a system test routine is executed. The output relays switch to the fault state as long as the test/reset button is pressed, the control contact S1-S3 is closed (or the test functions are processed).

The test function can be activated either with the front-face combined test/reset button or with a remote test button connected as shown in the picture.

Fault storage, reset function and remote reset

When fault storage  is active, the output relays remain in the fault state and only switch back to their original state after the combined test/reset button is pressed or after the remote reset (terminals S2-S3) is activated, and when the insulation resistance is higher than the set threshold value(s) plus hysteresis.

The fault storage is designed non-volatile (remanent). This means that after switch-off and return of the control supply voltage the device returns to the state it was prior to the switch-off until a reset is executed.

Depending on the configuration of DIP switch 2, there are several possibilities of resetting the device, as shown in the picture.

DIP switch 2

Configuration and settings

Rotary switches R1.1, R1.2, R2.1 and R2.2 (threshold values)

By means of four separate 10 position rotary switches  with direct reading scales, the threshold values for the insulation resistance R_F of the systems to be monitored can be adjusted.

With the Rx.1 rotary switch the tens figure is set and with the Rx.2 rotary switch the units figure is set. The set threshold value is then the addition of the two values. For example, R1.1 set to 70 and R1.2 set to 8 leads to a threshold value for R1 of 78 kΩ.

DIP switches

Position	4	3	2	1
ON ↑	2x1 c/o 			closed 
OFF	1x2 c/o 			open 

2CDC 252 050 F0009

	ON	OFF (default)
DIP switch 1 Operating principle of the output relays	Closed-circuit principle  If closed-circuit principle is selected, the output relays are energized. They de-energize if a fault is occurring.	Open-circuit principle  If open-circuit principle is selected, the output relays are de-energized. The energize if a fault is occurring.
DIP switch 2 Non-volatile fault storage	Fault storage activated (latching)  If the fault storage function is activated, the output relays remain in tripped position until a reset is done either by the front-face button or by the remote reset connection S2-S3. This function is non-volatile.	Fault storage de-activated (non latching)  If the fault storage function is de-activated, the output relays switch back to their original position as soon as the insulation fault no longer exists.
DIP switch 3 Interrupted wire detection	Interrupted wire detection activated  With this configuration, the CM-IWN monitors the wires connected to L+ and L- for interruptions.	Interrupted wire detection de-activated  With this configuration the interrupted wire detection is de-activated.
DIP switch 4 2 x 1 c/o, 1 x 2 c/o	2 x 1 c/o (SPDT) contact  If operating principle 2 x 1 c/o contact is selected, the output relay R1 (11-12/14) reacts to threshold value R1 (warning) and the output relay R2 (21-22/24) reacts to threshold value R2 (prewarning)	1 x 2 c/o (SPDT) contacts  If operating principle 1 x 2 c/o contacts is selected, both output relays R1 (11-12/14) and R2 (21-22/24) react synchronously to threshold value R1 (warning). Settings of the threshold value R2 have no effect on the operation.

Indication of operational states

LEDs, status information and fault messages

Operational state	LED U (green)	LED F (red)	LED R (yellow)
Start-up		OFF	OFF
No fault		OFF	1)
Prewarning			
Insulation fault (below threshold value)			1)
KE/⊥ wire interruption			1)
L+/L- wire interruption during system start-up / test function			1)
System leakage capacitance too high / invalid measurement result			1)
Internal system fault	1)		1)
Setting fault ²⁾			
Test function		OFF	1)
No fault after fault storage ³⁾		4)	

1) Depending on the configuration (see "Function descriptions/diagrams" on page 6).

2) Possible faulty setting: The threshold value for warning is set at a higher value than the threshold value for prewarning.

3) The device has triggered after an insulation fault. The fault has been stored and the insulation resistance has returned to a higher value than the threshold value plus hysteresis.

4) Depending on the fault

electrostatic discharge	IEC/EN 61000-4-2	Level 3, 6 kV / 8 kV
radiated, radio-frequency, electromagnetic field	IEC/EN 61000-4-3	Level 3, 10 V/m (1 GHz) / 3 V/m (2 GHz) / 1 V/m (2.7 GHz)
electrical fast transient/burst	IEC/EN 61000-4-4	Level 3, 2 kV / 5 kHz
surge	IEC/EN 61000-4-5	Level 3, installation class 3, supply circuit and measuring circuit 1 kV L-L, 2 kV L-earth
conducted disturbances, induced by radio- frequency fields	IEC/EN 61000-4-6	Level 3, 10 V
voltage dips, short interruptions and voltage variations	IEC/EN 61000-4-11	Class 3
harmonics and interharmonics	IEC/EN 61000-4-13	Class 3
Interference emission		IEC/EN 61000-6-3, IEC/EN 61000-6-4
high-frequency radiated	IEC/CISPR 22, EN 55022	Class B
high-frequency conducted	IEC/CISPR 22, EN 55022	Class B

Start-up times CM-IWN.6

Certain parameters, such as voltage variations and frequency fluctuation etc., may have an impact on these start-up times. The initialization of the CM-IWN with default values can result in a start-up time (incl. first measuring cycle) that is shorter than the later maximum duration of a measuring cycle.

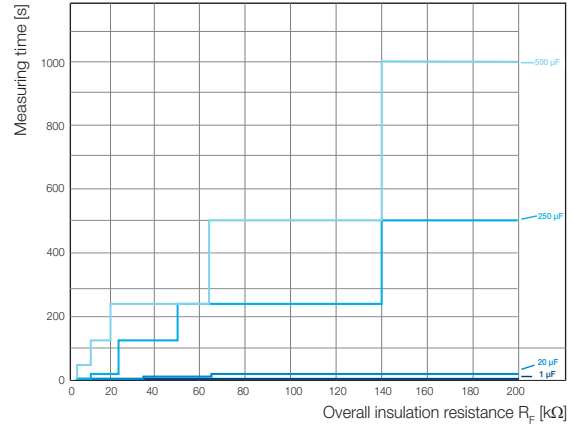

Typical measuring times

The indicated time values are the pure measuring times in a stable system, not considering the start-up times. Certain parameters, such as voltage variations and frequency fluctuation etc., may have an impact on these measuring times.

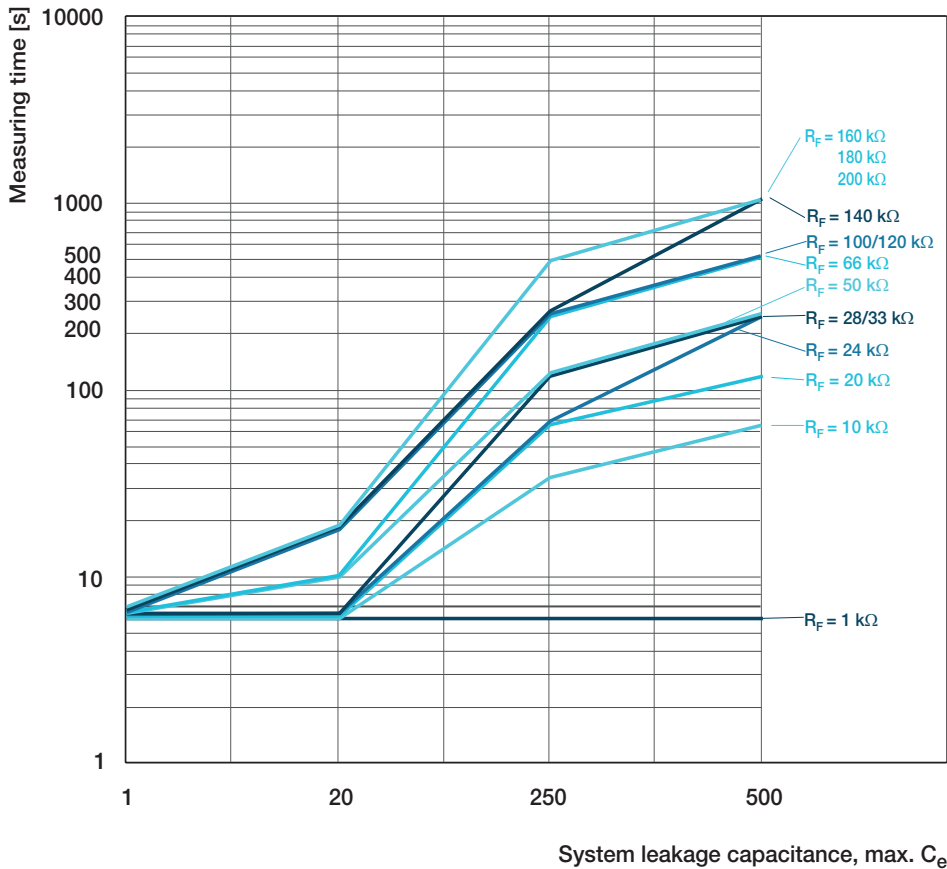

When an insulation fault occurs, the maximum reaction time until the output relays switch is 2 times the typical measuring time, provided that no other parameters in the system change.

Measuring times of CM-IWN.4
