# FAIRCHILD

#### **T5220 SERIES TRANSDUCER**

Electro-Pneumatic (I/P, E/P)

#### **APPLICATIONS**

The T5220 Series Electro-Pneumatic Transducer converts a DC current or voltage input signal to a directly proportional pneumatic output.

The T5220 Series is designed for precision applications, providing maximum versatility in installations requiring precision operation of actuated valves or final control elements.

The integrated booster in the Model T5220 provides increased output pressure and flow for systems which require output pressures and flows greater than those provided by the Model T5200.

#### **FEATURES**

#### **Performance**

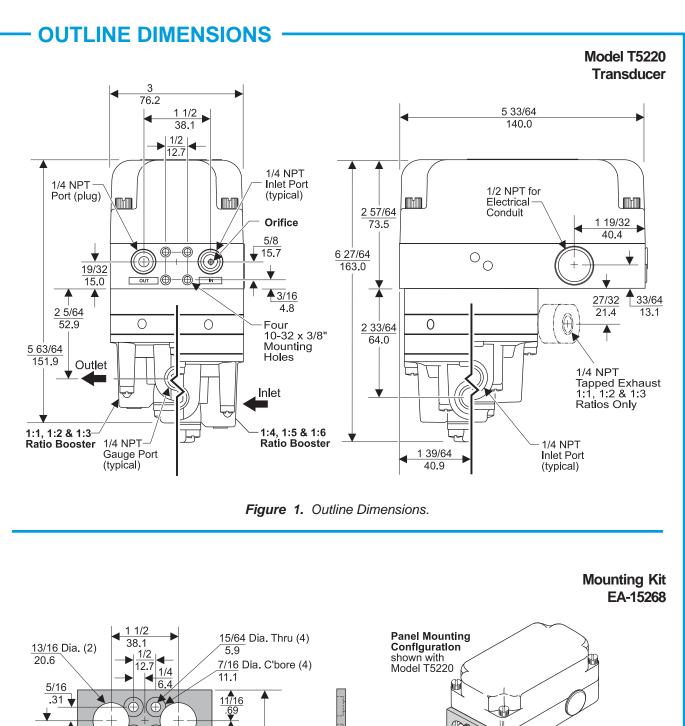

- Fast Response to Input Signal changes results in faster loop control and savings in process materials.
- Integrated Volume Booster Output meets input requirements of final control elements requiring a higher capacity output signal and/or increased output pressure.

#### **Functional**

- Five Input Signal Ranges meet most process and machine requirements.
- Negative Bias Option allows zero pressure based operation.
- Five Booster Ratios meet industrial equipment requirements for higher output pressure ranges.
- Temperature Compensation provides stable operation under environmental changes.

#### **Physical**

- Compact Size permits use in space restricted areas.
- Vibration Resistance maintains set points under adverse vibration conditions.
- Various Mounting Configurations allow installation flexibility for most applications.
- NEMA 3R Enclosure for outdoor and indoor installations.
- Conduit Port for convenient wiring.
- External Zero Adjustment allows ease of calibration.

Approvals are valid when connected through a Shunt Zener Diode Safety Barrier meeting the following parametric requirements:

Rated: 28V Maximum 300 Ohm Minimum

## **INSTALLATION**

For Installation Instructions refer to the *Fairchild T5220 Series Electro-Pneumatic Transducer IOM,* **IS-500T5220.** 

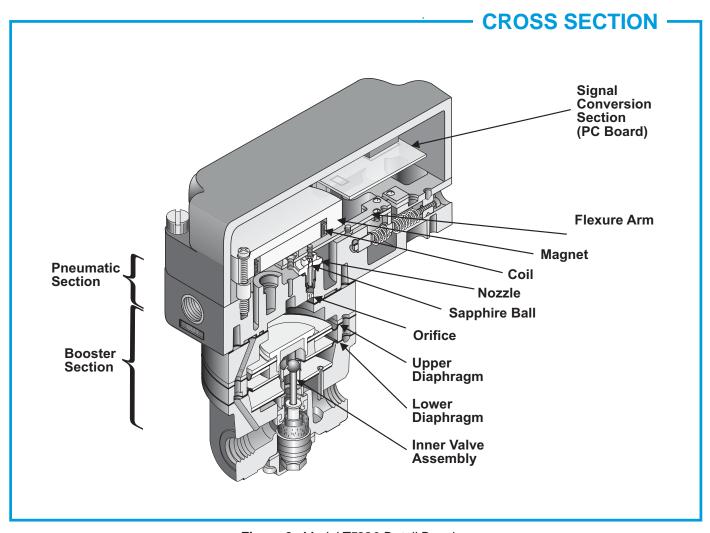

Figure 6. Model T5220 Detail Drawing.

## **OPERATING PRINCIPLES**

The T5220 Transducer is an electro-pneumatic device that converts a DC current or voltage input signal to a proportional pneumatic output. This device is made up of two sections, the Signal Conversion Section and the Pneumatic Section.

The Signal Conversion Section (PC Board) accepts a DC current or voltage. This signal current is applied to a coil which creates a magnetic force that moves a Flexure Arm.

The Pneumatic Section operates as a force balance system. A Sapphire Ball floats inside a Nozzle

and controls the output pressure by exhausting air supplied through an Orifice. This Sapphire Ball acts as a piston exerting a force which is balanced against the force transferred to the Flexure Arm by the Coil.

The Booster Section amplifies the output pressure of the transducer. At set point, the force due to transducer output pressure acting on the top of the Upper Diaphragm is balanced by the force due to booster output pressure acting on the underside of the Lower Diaphragm. For more information, see Figure 6. "Model T5220 Detail Drawing" above.

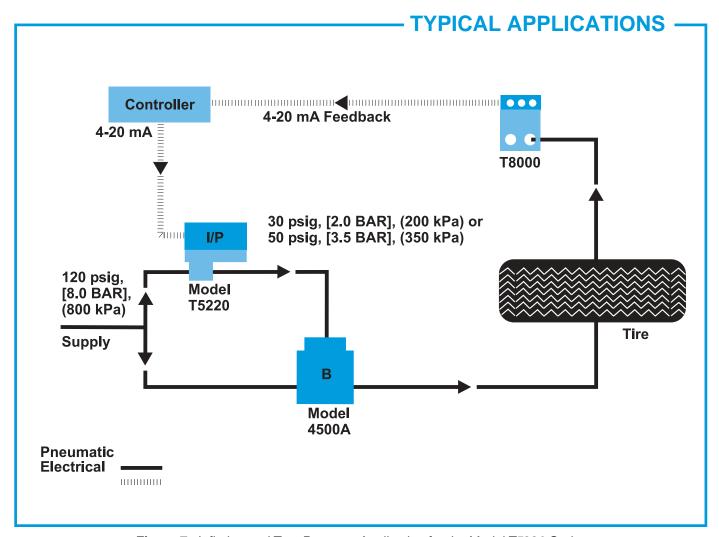

Figure 7. Inflation and Test Pressure Application for the Model T5220 Series.

## TYPICAL APPLICATIONS

This application of the T5220 Series controls the inflation pressure and test pressure of a tire in a testing machine. An electronic controller provides a 4-20 mA signal to a T5224-4 transducer.

The output of this transducer is used as the signal to a Model 4516 booster, which provides 50 psig, [3.5 BAR], (350 kPa) to set the tire on the bead and then reduces the pressure to 30 psig, [2.0 BAR],

(200 kPa), where it is accurately controlled during the testing of the tire.

A T8000 P/I measures the pressure in the tire during testing and provides a 4-20 mA feedback signal to the controller for closed loop control. For more information, see Figure 7. "Inflation and Test Pressure Application for the Model T5220 Series." above.

<sup>1</sup> Standard unit is configured for common supply to transducer and booster.

ISO 9001:2000 Certified

FM NO. 25571

Units require 20 psig, [1.5 BAR], (150 kPa) for transducer and a separate supply for booster. A common supply of up to 110 psig, [7.7 BAR], (770 kPa) can be used provided the prefix Z147 is added to the original order, & the supply pressure is noted.

Factory Mutual Approval Only.

Intrinsically Safe Units cannot be set for Reverse Acting Mode in field.

<sup>&</sup>lt;sup>3</sup> If high flow (SCFM) is required for the standard 1:1 ratio, select HI Option.

Refer to Table 1. for Pressure Ranges.

Units shipped calibrated 4-20 mA; 10-50 mA units must be calibrated in field.

<sup>&</sup>lt;sup>6</sup> Not approved for intrinsically safe ratings.
